

# Ortho Eyes

Raphael Pickl, Brice Lang-Nguyen,  
Eddie Versluis, Hassan Ali, Arjun Sardjoe  
Missier, Lennart van Koppen, Rachelle Kiepe,  
Dr. Tony Andrioli

# Introduction

- Laboratorium for Kinematics en Neuromechanics (LK&N)
- Improving treatment and diagnosis of musculoskeletal system issues
- Our research is focused on shoulder issues

# From Goniometer to Xbox-Kinect

# History of the project

- First iteration (2017)
  - *Research with kinect*
- Second iteration (2018)
  - *Flock of birds – logistic regression*
- Third iteration (2019)
  - *Flock of birds – Verifying the last groups work*

**To what extend and in what way, can different data science techniques be used on kinematic recordings to contribute to a more valid and more reliable diagnosis, made by a doctor, on shoulder disability.**

# Up to this point

- *Get the best possible data from the LUMC*
- *Clean our data*
- *Enrich our data*
- *Create different configurations for the Logistic Regression*

# The Dataset

# The Data

- FoB system
  - *Giant Electro-Magnetic field generator*
- Consists of multiple Hall Sensors
  - Reads Magnetic Field
  - Returns them as XYZ coordinates of bone structures
  - This Data is translated to relational XYZ angles

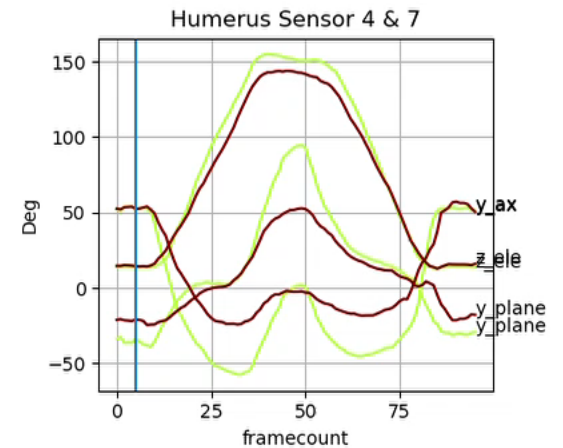

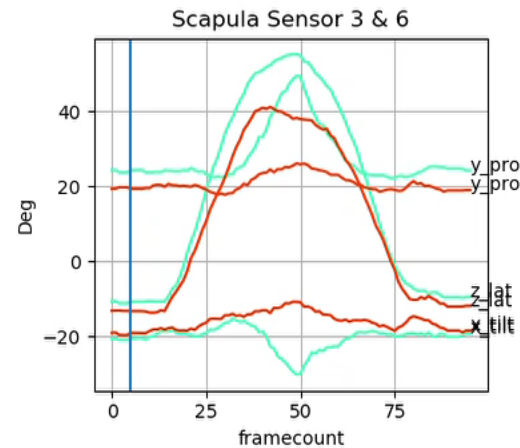

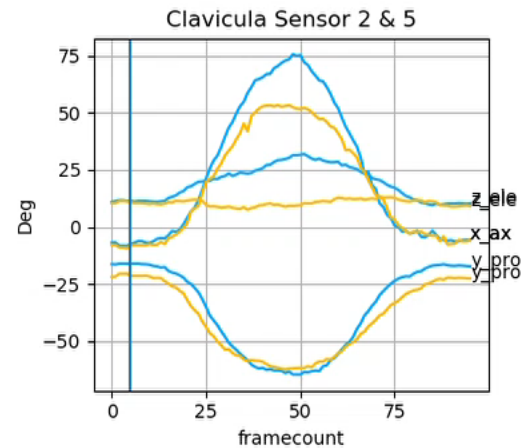

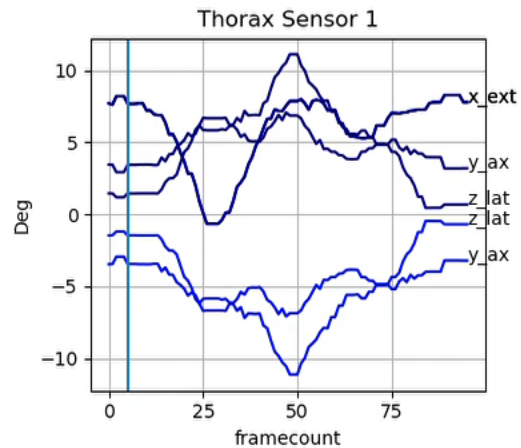

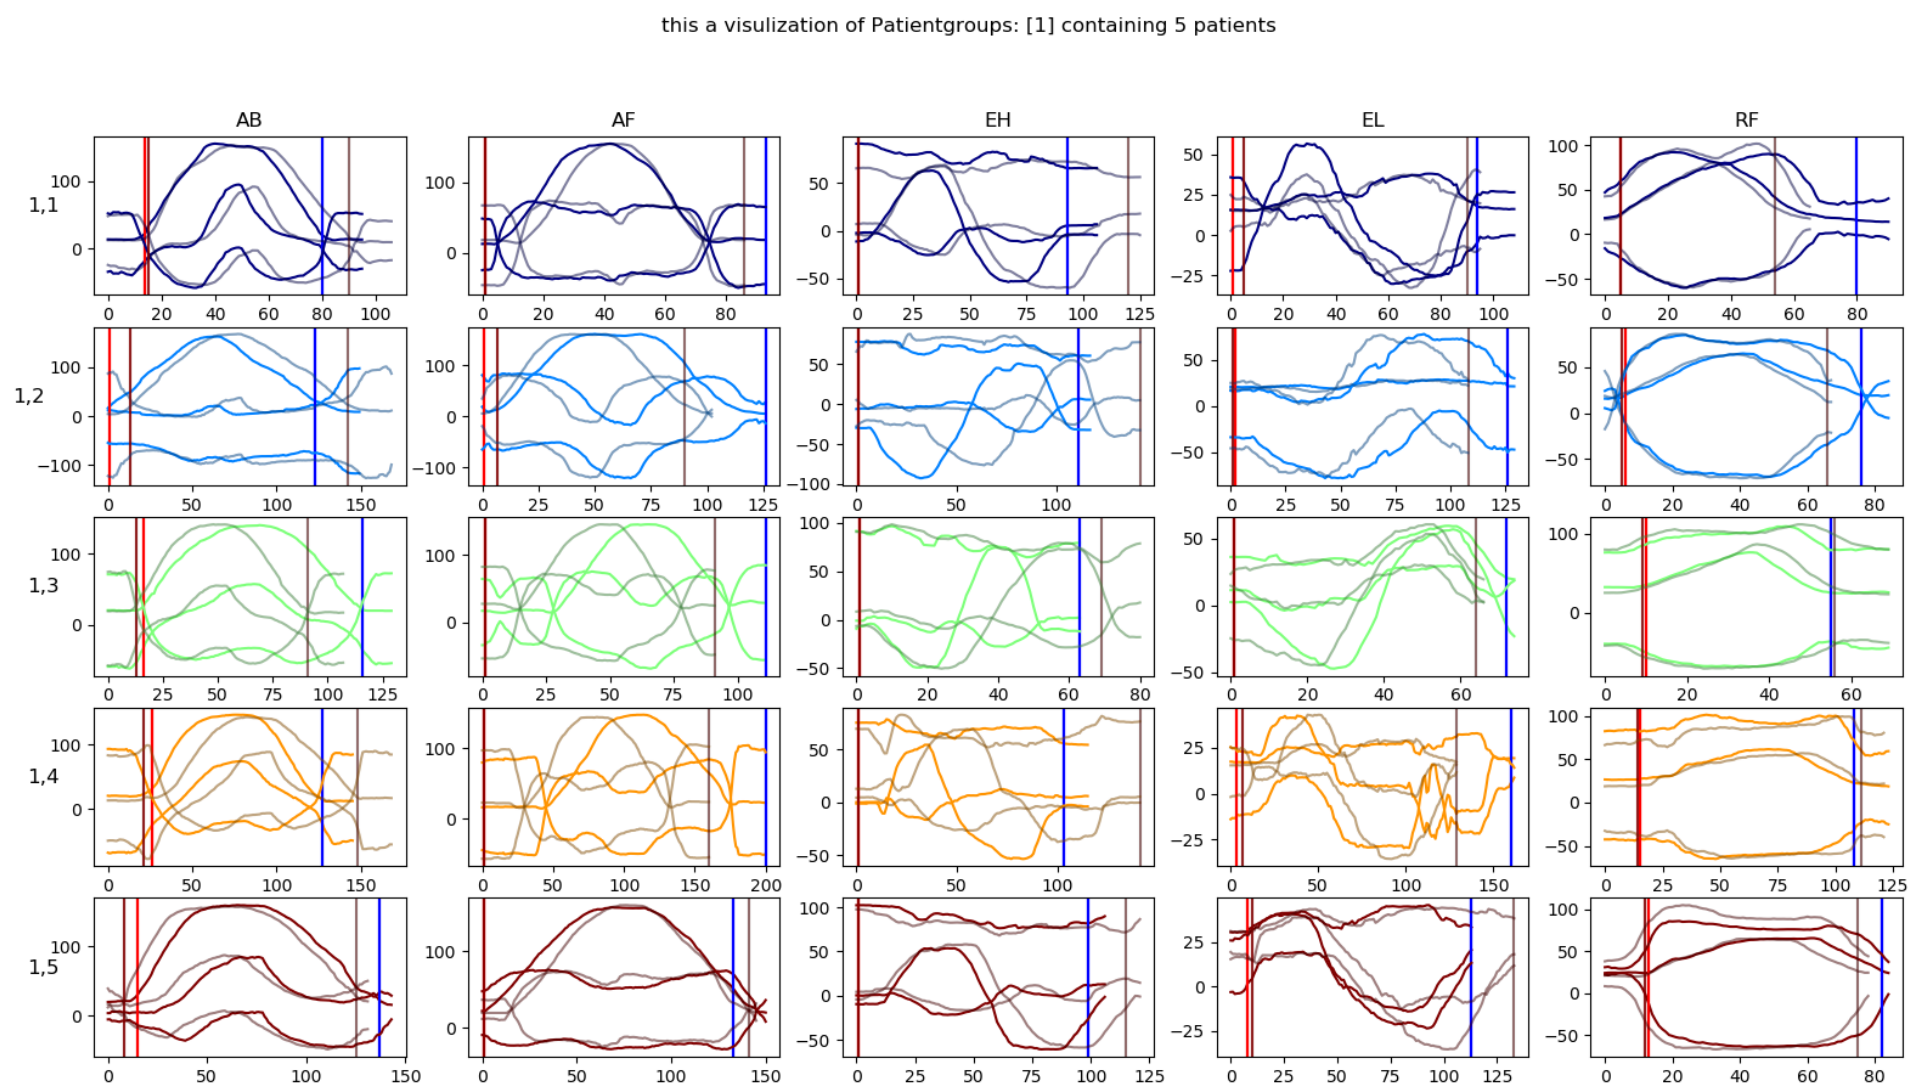

# How we see the data

group: 1 - patient: 1 - exercise: AB1.csv

# Data Cleaning

# Removing the idle

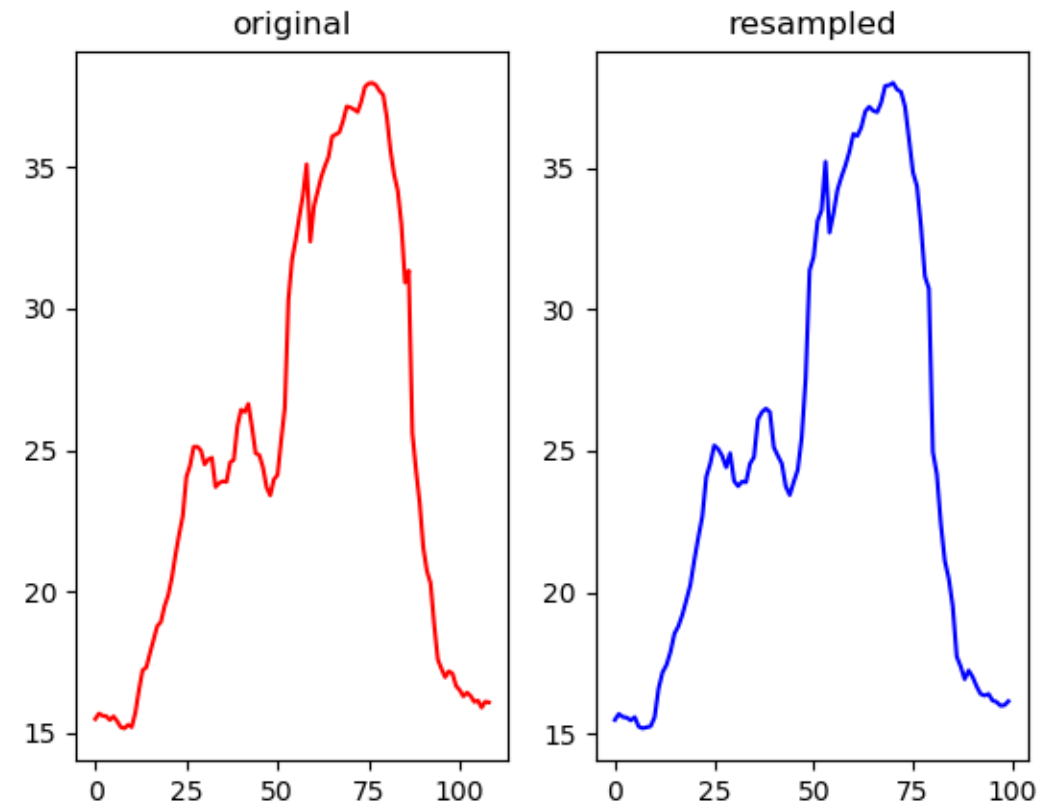

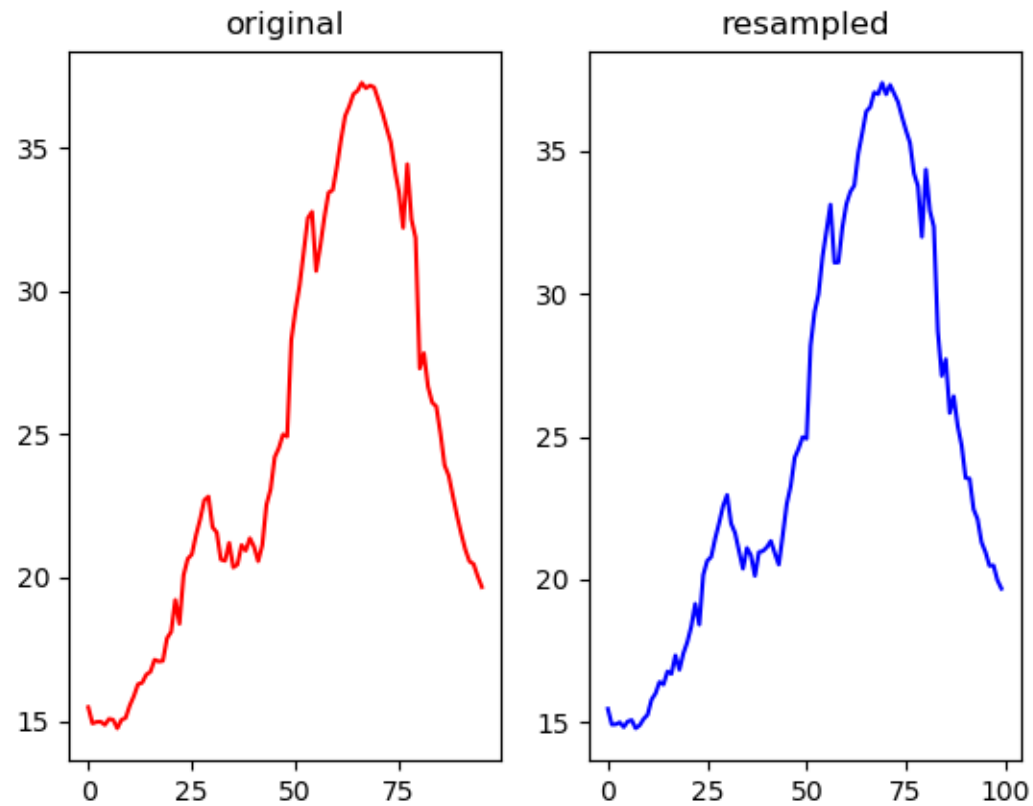

# Splitting double exercises

- Detect “double exercises”

# Data Enrichment

# Resample exercises

# Frame Generator

					↓					↓
Frame index:	1	2	3	4	5	6	7	8	9	10

				↓	↓				↓	↓
Frame index:	1	2	3	4	5	6	7	8	9	10

AB1.csv

# Space description

8 cluster

# State of the Project

We're training Logistic Regression Model

- *Evaluate the model based on the different configurations*
- *Write our research paper on the findings*

# Latest Result
